Chief Complaint

Follow-up

History of Present Illness

40-year-old man presents today for follow-up phone visit. Consents to today's visit and denies current SI, HI, AH, VH. He confirms current location. He states he evaluates his day based on the hours that he is productive during the day.

He states this can vary depending on his stressors. He feels that Adderall has been helpful, but feels it would be better at the 20 mg twice daily dosing. He states he is not usually able to be around people due to irritability and poor frustration tolerance. He states he becomes agitated when faced with stimuli, and wants to leave situations. He states he is trying to navigate this to maximize his daily activities and employment. He states he is interested in a brain scan for PTSD for his disability hearings. I informed him that brain scans do not usually use to diagnose PTSD as this is primarily a clinical diagnosis. He otherwise denies side effects from medications. He currently denies manic or psychotic symptoms. He denies any illicit substance use.

Review of Systems

On interview denies current headache, chest pain, shortness of breath, abdominal pain, nausea vomiting. 10 point review of systems otherwise unremarkable.

Exam

Cooperative, normal volume and rate of speech. Reports irritable mood with linear, goal-directed thought process. Nondelusional thought content. Currently denies SI, HI, AH, VH. Fair insight and judgment, with good impulse control.

Assessment/Plan

ADD (attention deficit disorder)

Bipolar disorder

PTSD (post-traumatic stress disorder)

40-year-old man presents today for follow up visit. He carries diagnoses of bipolar disorder, PTSD, and ADD. He is recently had an inpatient hospitalization due to concerns about paranoia and psychotic thought process. Some of this was in the context of concerns about increasing use of Adderall among other symptoms. He states with medication changes he has not been feeling well, while he has been stable on most recent medications. He focuses on Adderall use, and reports this helps with both focus, and ability to cope. He is asking for higher doses. With patient's long history of stability, it is reasonable to go back to prior medications. He also has a history of taking lower doses of Adderall without abuse for a long amount of time. In the past with higher doses of stimulant medications he has a history of worsening irritability, paranoia, and symptoms that led to hospitalization.

He continues to report some irritability, difficulty tolerating external

Medications

Adderall XR 20 mg oral capsule, extended release,

40 mg, 2 capsule, ORAL, qAM (every morning)

citalopram 20 mg oral tablet, 20 mg, 1 tablet,

ORAL, Daily

Goodys Extra Strength, See Instructions

Med List Status - Updated

metFORMIN, 500 mg, **Not taking**
