“ I could figure out how to load the session file into that class.”

- a big part of my problem is that I had trouble understanding where his classes were being loaded from, meaning what script. Here I am talking about the guy that developed the rental application, not the guy that developed the payment form plug-in. It was a Joomla based application.

The developer of the rental application was a real nice guy that would answer questions that they posted to him. The people who hired me had some kind of access to him, and would send him my questions.

I can't remember exactly how it went. I just remember I eventually decided to write my own code from scratch. The longer I go the sicker I get of writing big blocks of code. The purpose of frameworks is to save you from that. As time goes on, I will eventually develop my own framework. I already have made progress in doing this, actually. I trust my own code more than I trust anyone else's code. I am a perfectionist. It will take me god knows how long to do it, but I eventually will.

This thing of not being able to understand how his classes were loaded, this is a lack of knowledge on my part. It was a lack of knowledge that the plugin developer had too, and probably that all of his plugin developers had. The system depended on the file names of the php files you create. The plugin developer told me that the developer of the main system told him what to name his files, and that he had no clue about the rhyme and reason behind this.

Warmest Regards,

Clint Williams
