Re: Email for July 28, 2023

To: "Division, Criminal (CRM)" <Criminal.Division@usdoj.gov>, civil.feedback@usdoj.gov

I'm trying not to tell you off so much and I'm not doing good. Todays project has largely consisted of setting up a login page for my website. I have a library that I pulled from GitHub. It is used for login systems and it is very nice. If you don't know what a library is, it is a bunch of programming that has been written and put into a package. It will often serve a single purpose. It saves you loads of time. It would take me forever and a day to program something like this from scratch.

What you have to do is integrate the library with your application. This will require you writing some of your own code. I have been wanting to make an add on package for me personally, that I could easily port to any application that I make. I have a certain way of doing things, and I do them similarly on each application that I make. The add on package, used with the main package, would be the equivalent of a Wordpress plugin for my applications. It would conform to my architecture. If I built such a package, I could set up the login system or any new web app I built in 25 minutes or less. Could possibly be a lot less. I'd just have to copy the folder with my scripts and paste it into the main folder for my website (called the root), upload the sql file to my database server, and then make some edits on a prebuilt html file.

And I'm not a beginner. I don't think so. There are a lot of people that I can teach. I have had a lot of people asking me questions, on different forums. I'm still not good on paper though.

Warmest Regards,

Clint Williams
