Re: Email for September 29, 2023

To: "Division, Criminal (CRM)" <Criminal.Division@usdoj.gov>, civil.feedback@usdoj.gov

The main thing I'm interested with right now is my ChatGPT project. It will be hard for me to pull myself from it, when I'm able. I will take a long time, it's looking like. I'm doing a pclr test with ChatGPT scoring and giving feedback. The initial impression is that I have way overshoot my actual score on all of my self analyses. ChatGPT has been fed the manual, I am sure. It seems to have been fed all kinds of stuff related to this. It gives thorough answers. I am using the GPT-4 engine, which scored 84.7% on the medical licensing exam. And that score is old. GPT-4 has been updated as recently as last month.

I would hate to even think of the server resources that thing uses. The AI is written in python, which is a resource intensive language. It's much slower than Java. And it answers you fast. Like in an instant in many cases. When you have millions of people using server resources on a slow language, and it's doing very, very complex tasks, and it performs so well, the only explanation is that you've got massive hardware.

But this analysis is requiring me to tell my whole life's story. I didn't anticipate this, but that's how it's turning out. I have trouble being brief. That's one factor. It's like everything I understand is based on, dependent upon, or connected to something else, and I use the whole picture to understand it. I have trouble not unwinding the entire architecture when I explain things to people or to AI.

Warmest Regards,

Clint Williams
