Putting aerosol in the atmosphere is one of the most promising things I have heard. Most scientists think that it is a disaster waiting to happen, but I think if we can be really careful and deliberate, we can develop a solution. That's especially if we're aided by AI.

And idk if the term server farm is valid. What I'm saying is massive collection of computers with extreme computing power, all contributing to running one powerhouse AI application.

People may have doubts about our ability to develop sufficiently capable AI. They may be right on doing that, but I'm not so sure. If our AI technology improves by not too much, we will be at the point where we can have an AI build another AI, with superior capabilities.

But it's all probably just me dreaming. What destruction I have witnessed and will witness in my life.

Warmest Regards,

Clint Williams
